Gaian Systems - Bruce Clarke 2020-09-29
A groundbreaking look at Gaia theory's intersections with neocybernetic systems theory. Often seen as an outlier in science, Gaia has run a long and varied course since its formulation in the 1970s by atmospheric chemist James Lovelock and microbiologist Lynn Margulis. *Gaian Systems* is a pioneering exploration of the dynamic and complex evolution of Gaia's many variants, with special attention to Margulis's foundational role in these developments. Bruce Clarke assesses the different dialects of systems theory brought to bear on Gaia discourse. Focusing in particular on Margulis's work—including multiple pieces of her unpublished Gaia correspondence—he shows how her research and that of Lovelock was concurrent and conceptually parallel with the new discourse of self-referential systems that emerged within neocybernetic systems theory. The recent Gaia writings of Donna Haraway,

Isabelle Stengers, and Bruno Latour contest its cybernetic status. Clarke engages Latour on the issue of Gaia's systems description and extends his own systems-theoretical synthesis under what he terms "metabiotic Gaia." This study illuminates current issues in neighboring theoretical conversations—from biopolitics and the immunitary paradigm to NASA astrobiology and the Anthropocene. Along the way, he points to science fiction as a vehicle of Gaian thought. Delving into many issues not previously treated in accounts of Gaia, *Gaian Systems* describes the history of a theory that has the potential to help us survive an environmental crisis of our own making.

The Development Dictionary - Wolfgang Sachs 1992

In this pioneering collection, some of the world's most eminent critics of development review the key concepts of the development discourse in the post-war era. Each essay examines one concept from a historical and anthropological point of view and highlights its particular bias. Exposing their historical obsolescence and intellectual sterility, the authors call for a bidding farewell to the whole Eurocentric development idea. This is urgently needed, they argue, in order to liberate people's minds - in both North and South - for bold responses to the environmental and ethical challenges now confronting humanity. These essays are an invitation to experts, grassroots movements and students of development to recognize the tainted glasses they put on whenever they participate in the development discourse.

Clay Materials Used in Construction - George M. Reeves 2006

Concluding the trilogy on geological materials in construction, this authoritative volume reviews many uses of clays, ranging from simple fills to sophisticated products. Comprehensive and international coverage is achieved by an expert team, including geologists, engineers and architects. Packed with information prepared for a wide readership, this unique handbook is also copiously illustrated. The volume is dedicated to the memory of Professor Sir Alec Skempton. Various definitions of 'clay' are explored. Clay mineralogy is described, plus the geological formation of clay deposits and their fundamental materials properties. World and British clay deposits are reviewed and explained. New compositional data are provided for clay

formations throughout the stratigraphic column. Investigative techniques and interpretation are considered, ranging from site exploration to laboratory assessment of composition and engineering performance. Major civil engineering applications are addressed, including earthworks, earthmoving and specialized roles utilizing clays. Traditional earthen building is included and shown to dominate construction in places. Clay-based construction materials are detailed, including bricks, ceramics and cements. The volume also includes a comprehensive glossary.

Environmental Science and Technology - Frank R. Spellman 2017-09-15

The third edition of Environmental Science and Technology: Concepts and Applications is the

first update since 2006. Designed for the student and the professional, this newly updated reference uses scientific laws, principles, models, and concepts to provide a basic foundation for understanding and evaluating the impact that chemicals and technology have on the environment. Building upon the success of previous edition, the third edition has been expanded and completely updated. A significant change can be found in the expansion and treatment of all subject areas. Extensive energy parameters have been added to the text along with a thorough discussion of non-renewable and renewable energy supplies and their potential impact on the environment. In addition, thought-provoking questions have been added at the end of each chapter. Finally, pictorial presentation has been enhanced by the addition of numerous photographs. Organization and Content: Environmental Science and Technology: Concepts and Applications is divided into five parts and twenty-five chapters, and organized to provide an even and logical flow of concepts. It provides the student with a clear and thoughtful picture of this complex field. Part I provides the foundation for the underlying theme of this book—the connections between environmental science and technology. Part II develops the air quality principles basic to an understanding of air quality. Part III focuses on water quality, and the characteristics of water and water bodies, water sciences, water pollution, and water/wastewater treatment. Part IV deals with soil science and emphasizes soil as a natural resource, highlighting the many interactions between soil and other components of the ecosystem. Part V is devoted to showing how decisions regarding handling solid and hazardous waste have or can have profound impact on the environment and the three media discussed in this text: air, water, and soil. Finally, the epilogue looks at the state of the environment, past, present, and future. The emphasis in this brief unit is on mitigating present and future environmental concerns by incorporating technology into the remediation process—not by blaming technology for the problem.

The Earth System - Lee R. Kump 2004

"The Earth System, Second Edition" employs a systems-based approach to examine Earth science at the global level. This text explores how: Earth's processes have connections to the past and to each other Seemingly small-scale changes to Earth can have large-scale effects Processes that are occurring now are molding the course of the future The second edition incorporates two new chapters: Modeling the Atmosphere-Ocean System--A discussion of why

numerical models are necessary, how they are used, what they can tell us about past and future climates, and what their limitations are. A Focus on the Biota: Ecosystems and Biodiversity-- Focuses on life's role in the Earth system, how ecosystems function, what biodiversity is, and whether or not biological diversity enhances the stability of ecosystems. Three categories of boxed text are included and offer a deeper study of the topics presented. A Closer Look--Includes more advanced concepts, results from current research, and explanations of interesting phenomena. Important Concepts--In-depth presentations of fundamental concepts from the natural sciences essential to our understanding of the Earth system. Thinking Quantitatively-- Demonstrates how simple mathematics can be used to better understand the workings of the Earth system.
